Danfoss

living by Danfoss heating control

Bedtime. Savings mode: **on**

Save energy the intelligent way - with *living by Danfoss* heating control and radiator thermostats.

Up to
23%
energy savings can
easily be achieved.
Read the case stories
on our website.

living.danfoss.com

You typically save 5% energy every time you reduce the temperature by 1°C

How to achieve up to 23% energy savings on heat consumption:

- Exchange your old radiator thermostats (older than 15 years) for *living by Danfoss* thermostats (see overview)
- Keep the same at home temperature as before changing to *living by Danfoss* thermostats
- Lower the temperature to 17°C degrees during Away / Asleep periods, including at night and during working hours (e.g. select "P2" program for *living eco*® thermostat)
- Choose 'Vacation' function when you are on vacation
- If you set different temperatures in different rooms, remember to close doors between rooms

Important:

Energy savings are achieved only through a reduction in room temperature. *living by Danfoss* will do this for you automatically.

What does saving up to 23% of your heat consumption mean?

You can save up to 23% of energy used for "space" heating; normally, two-thirds of the total heat bill is used for space heating. The heat bill also consists of hot tap water and fixed expenses (only valid for district heating).

How old are your radiator thermostats?

To reach up to 23% energy savings, here are some factors to consider:

- Make sure your heating system is correctly set and dimensioned for temperature set back (check with your installer)
- Prior to installation of *living by Danfoss* thermostats, your heating system already had night set back (heat pumps, boilers) or you have been turning the heat down manually at night
- External conditions affect the level of energy consumption (kWh) used each year. Examples of external conditions: free heat (e.g. sunlight), outdoor temperature, use of stove, wind, etc.
- Brick and concrete buildings (heavy buildings) store heat better than light buildings made of wood and plaster. Well insulated buildings also store heat better than poorly insulated buildings. It can be more difficult to achieve up to 23% energy savings, if your home is heavily built and well insulated

The intelligent, elegant upgrade

living connect® was the first electronic thermostat ever to achieve the prestigious A+ energy certificate from eu.bac (European Building Automation and Controls Manufacturers' Association – www.eubac.org).
